## TeamMate Hosting Solution

### What is TeamCloud Hosting?

TeamCloud allows your organization to concentrate on building your business, not your infrastructure. TeamCloud hosting provides secure access to your custom TeamMate environment via the web. It is a cost-effective alternative, powerful and stable environment without the burden of deploying and maintaining software or the associated infrastructure.

### Why TeamCloud is right for your organization

#### Your data is available when you need it

Your information resides on our managed servers. Your employees can access the audit programs, work papers, recommendations and other TeamMate data securely through the web anytime, anywhere. Automatic updates of software releases allow you to access to the latest TeamMate features instantly.

#### Achieve significant cost savings

The cost of a hosted solution is significantly lower than that of developing it in-house. There is no need to purchase and manage additional hardware as your TeamMate databases expand. The involvement of your IT staff is minimized as we support, manage and monitor performance.

#### Your information is protected from physical risks

Industry standard firewall, backup, and data center security technologies and processes are in place to keep your data available and secure. All traffic is secured using SSL encryption protocols and the hosted systems are operated under the controls, security, and audit process of a SOC 2, Type II hosting facility.

#### Comprehensive hosting support

System availability is constantly monitored with automatic notification of outages to the TeamMate support team. Hosting clients have full access to our support team to assist with general and technical questions about using the TeamMate suite.

## Existing & Upcoming Data Centers

*Data centers currently exist in Dallas and London. Sydney will be on-line in Q2 2015 and Canada is planned for mid-2015. Washington DC area is custom built per client.*
